

# Reinventing a DNA sequence reader

Aleksei Aksimentiev

University of Illinois at Urbana-Champaign

# DNA code is written in atoms

Highly charged: 2 electron charges per 0.32nm

Double stranded DNA  
(persist. length ~50nm)

The sequence has direction:  
5'-AAGCTGGTTCAG-3'

Single stranded DNA  
(persist. length ~1.5nm)

# DNA code is written in atoms

Highly charged: 2 electron charges per 0.32nm

Double stranded DNA  
(persist. length ~50nm)

The sequence has direction:  
5'-AAGCTGGTTCAG-3'

**backbone**

Single stranded DNA  
(persist. length ~1.5nm)

# The Human Genome Project

Duration:  
October 1990 - 2003

Discovered ALL  
20,000-25,000  
human genes

Determined complete sequence of the 3 billion DNA bases

## A Resource for Studying Biological Macromolecules

The PDB archive contains information about experimentally-determined structures of proteins, nucleic acids, and complex assemblies. As a member of the [wwPDB](#), the RCSB PDB curates and annotates PDB data according to agreed upon standards.

The RCSB PDB also provides a variety of tools and resources. Users can perform simple and advanced searches based on annotations relating to sequence, structure and function. These molecules are visualized, downloaded, and analyzed by users who range from students to specialized scientists.

### Molecule of the Month: Hydrogenase

Hydrogen gas is an unusual substance. Normally, it is stable and must be coaxed with powerful catalysts to enter into chemical reactions. But when mixed with oxygen, a tiny spark will set off an explosive chain reaction. Hydrogen gas holds great promise to be the greenest of green energy sources. It has many advantages: compared with many fuels, it releases a lot of energy for its weight, and the reaction forms only energy and pure water. It has substantial disadvantages, however. It is dangerous to store, and it is difficult to perform the reaction in a controlled, non-explosive manner.
